I have years experience working with Excel pivot tables and using Microsoft Access databases as a backend. I just recently got a copy of Excel 2016 and wanted something to help me get started with PowerPivot and the DAX engine. The UI and terminology is just different enough I didn't want to slog through it myself. This book has been perfect in that respect. It starts off assuming you have a good working knowledge of things like tables, relationships, pivot tables, and databases in general, and then shows you how to plug the DAX engine into all of that. This is not a book for Excel Pivot Table beginners, but a book for DAX/PowerPivot beginners. I disagree with some of the reviewers that the book needs an editor. I've personally not found that to be the case. I found the writing style engaging, with complex subjects approached from different angles. One issue I have with the book, and the reason I gave it 4 stars instead of 5, is the content that comes with it. The book has no files or CD inside, but it has a link to a ZIP file on their web site with all sorts examples. The problem is everything is done. So when you open up the workbook for CHAPTER 6, there is nothing to do but look at it. I found myself deleting a bunch of stuff, which is tedious as you cannot bulk-delete Measures in PowerPivot. As much of the book seems to build not only in concept through each chapter, but also with the data model, I went back and grabbed the CHAPTER 4 workbook. This is where the meat of the book really starts. I am working back through to chapter 9 (my current position in the book) and building the Measures, Calculated Columns, etc.

If you have the first edition of this book, buy this one immediately (as I did). This is a complete - and superb - overhaul of everything the first book taught us. Although I have subsequently read many of the standard Power Pivot/Query/BI books out there, these authors effectively stake their claim to be the best evangelists to bring Power Pivot to beginners and intermediate users. If you have not purchased any edition... buy this immediately. The authors have a good sense of the business needs their readers are trying to address. You'll need to understand Excel of course, but less than you might think. Power Pivot and DAX are a separate offshoot of Excel's functionality and you don't need to learn VBA or be familiar with more than the 5% of Excel's functions that most of us deal with. What are those business needs? If you are looking to provide multiple views of large data sets to your customers, staff, or bosses, Power Pivot is the appropriate tool and this book will help you wield it. What situations are you dealing with? - Large data sets from ERP systems or experimental

data results with thousands of (almost identical) rows- You have to run a separate report for every department, customer, product, control group, or other breakdown- Rules for grouping and presenting the data vary by department or customer- Existing reports are tabular listings of multiple data points without any way to distinguish or separate the meaningful elements.- You'd like to give people a spreadsheet to manipulate the data as they see fit, but they don't have the skills or time to wade through the data.
